

Opportunity

Complex Reminder System

How it Works

Creating Opps

Users create Opps within the app and specify which conditions need to be filled before a notification is triggered

Triggering Notifications

Opps are periodically checked every so often and when the user's location changes significantly. If all conditions for an Opp pass, a notification is shown.

Features

Location

Set conditions based on geographic locations

Weather

Triggers based on the current temperature or whether it is sunny, cloudy, rainy, etc.

Time

Only be notified during specific times of the day

Availability

The app can check your calendar and only give you notification if you are free for a specific amount of time

Events

Get notified of local events you would normally never hear about

and More!

Ability to easily create more conditions, such as ski resort snow reports or store inventory

User Testing

Testflight Beta Testing

- ▣ Invite users to try app via email
- ▣ Update users automatically of new versions

Observation Testing

- ▣ Watch users use the app and gather metrics
- ▣ Improve user experience from user feedback and data gathered

Customer Acceptance Testing

- ▣ Time Condition Test
- ▣ Location Condition Test
- ▣ Weather Condition Test
- ▣ Availability Condition Test
- ▣ Deactivation Test
- ▣ Snooze Test
- ▣ Opp Interface Test

Performance Testing

- ▣ Application Side
- ▣ System Resources
- ▣ Battery Life
- ▣ Network Usage
- ▣ Server Side
- ▣ Availability
- ▣ Requests per Second
- ▣ Response Time

Demo

Thanks!

Any questions?
